

# **SYSTEM AND METHOD FOR PROXY-BASED REDIRECTION OF RESOURCE REQUESTS**

## **ABSTRACT OF THE DISCLOSURE**

A system and method are provided for requesting a resource over at least one network. The system includes a terminal, a host and a network proxy. The terminal can send a first request for the resource over a first network and a second network. In turn,  
5 the host can receive the first request and send a first response, where the first request identifies the resource at a first location on the host. The network proxy, which can communicate with the host over the second network independent of the first network, can receive the first response from the host, and reformulate the first request into a second request that identifies the resource at a second location. The network proxy can send the  
10 second request to a host of the resource at the second location such that the host of the resource at the second location can respond to the second request.
